Problem – Solution Fit

This document identifies the customer problem, existing behaviour, constraints and solution fit for importing spreadsheet data into a ServiceNow environment using Import Sets and Transform Maps.

1. CUSTOMER SEGMENTS ServiceNow administrators, application developers, IT support teams and data-entry/operations staff who need to import structured spreadsheet data into platform tables.	2. JOBS-TO-BE-DONE / PROBLEMS Users need to upload spreadsheet records quickly, map source columns to target fields, validate data and create/update records without manually entering every row.
3. TRIGGERS New bulk data received; migration from an existing spreadsheet; periodic updates; onboarding of records; correction of outdated records; need for faster data loading.	4. EXISTING BEHAVIOUR / ALTERNATIVES Manual record creation, copy-paste from spreadsheets, custom scripts, direct database workarounds, or repeated imports without consistent validation and mapping.

5. AVAILABLE SOLUTIONS ServiceNow Import Sets and Transform Maps provide a structured way to stage spreadsheet data, map source fields to target fields, transform values and control how records are inserted or updated.	6. CUSTOMER CONSTRAINTS Different column names and formats, missing values, duplicate records, incorrect data types, limited platform knowledge, large spreadsheets and the need to avoid corrupting existing records.
7. PROBLEM ROOT CAUSE Spreadsheet data is not naturally aligned with the target ServiceNow table structure. Field names, formats, reference values and record-identification rules often differ, requiring controlled transformation.	8. BEHAVIOUR Users commonly clean spreadsheets manually, attempt direct imports, investigate failed rows and repeat the process when mappings or formats are incorrect. Consistent mapping reduces repeated effort.
9. YOUR SOLUTION Create an Import Set, load the spreadsheet, define a Transform Map, map source fields to target fields, configure transformations and coalesce rules where required, run the transform, review errors and validate the target records.	10. CHANNELS OF BEHAVIOUR ServiceNow web interface, Import Set/Transform Map configuration, spreadsheet files (XLSX/CSV), data validation reports and administrator/developer workflows.

Solution Fit Summary

The proposed workflow fits the identified problem because it converts spreadsheet data into a controlled ServiceNow import process. Import Sets provide a staging area, while Transform Maps define how source data is matched, transformed and loaded into the target table. Validation and error review help users identify incorrect or incomplete records before final use.

Expected Benefits

1	Reduces manual data entry and repetitive copy-paste work.
2	Improves consistency between spreadsheet columns and ServiceNow fields.
3	Supports transformation, validation and controlled record creation/update.
4	Makes import errors easier to identify and correct.
5	Provides a repeatable process for future spreadsheet imports.
