

Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	30 September 2026
Team ID	SWTID-2026-5397
Team Size	5
Project Name	Import Data using Transform Maps (Spreadsheet)
Team Leader	LAVANYA S
Team Members	KAVIYA P; KEERTHANA J; LITHIKA P; MADHUMITHA R
Maximum Marks	4 Marks

Functional Requirements

Following are the functional requirements of the proposed solution for importing spreadsheet data into a ServiceNow target table using Transform Maps.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Spreadsheet Data Preparation	Create/validate spreadsheet columns; maintain required fields; save the file in a supported format.
FR-2	Import Set & Data Upload	Create an Import Set; upload the spreadsheet; validate source columns and imported records.
FR-3	Transform Map Configuration	Create Transform Map; select source and target tables; configure field mappings; define coalesce rules.
FR-4	Transform, Validate & Monitor	Run the transform; verify inserted/updated records; review transform logs and errors; correct rejected records.

Non-functional Requirements

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The import process should be simple to configure, easy to understand, and provide clear validation/error messages.
NFR-2	Security	Only authorized users should be able to upload data, configure Transform Maps, and modify target records.
NFR-3	Reliability	Valid spreadsheet records should be transformed consistently, with failed records and errors clearly identified.
NFR-4	Performance	The system should process normal spreadsheet uploads efficiently without unnecessary delays.
NFR-5	Availability	Import and transformation functions should be available whenever the ServiceNow instance is operational.
NFR-6	Scalability	The solution should support increasing spreadsheet sizes and record volumes without major redesign.

Import Data using Transform Maps (Spreadsheet)

Process Documentation

1. Objective

The objective of this project is to import data from a spreadsheet into a ServiceNow table using Import Sets and Transform Maps. The process maps spreadsheet columns to target-table fields, transforms the data when necessary, and validates the resulting records.

2. Tools / Components

Component	Purpose
Spreadsheet (XLSX/CSV)	Contains the source records and column values.
Import Set	Temporarily stores imported source data before transformation.
Import Set Table	Stores the uploaded spreadsheet data in ServiceNow.
Transform Map	Defines how source fields are mapped and transformed into target fields.
Target Table	Receives the final transformed records.

3. Step-by-step Procedure

Step	Activity	Description
Step 1	Prepare the spreadsheet	Create the required column headers and enter valid source data.
Step 2	Create an Import Set	Navigate to the import-data function and upload the spreadsheet.
Step 3	Review imported data	Check the Import Set Table and verify that source rows were loaded correctly.
Step 4	Create Transform Map	Select the source Import Set Table and the required target table.
Step 5	Map fields	Map each spreadsheet column to the corresponding target field.
Step 6	Configure transformation	Add field maps, scripts, coalesce rules, or other transformation logic if needed.
Step 7	Run Transform	Execute the transform and allow ServiceNow to create or update target records.
Step 8	Validate results	Check target records, transform history, logs, and error messages.

4. Expected Result

After a successful transform, valid spreadsheet records should appear in the selected target table with the correct field values. Any rejected or invalid records should be identifiable through the import/transform results so that they can be corrected and processed again.

5. Conclusion

The Transform Map process provides a structured way to load spreadsheet data into ServiceNow. By validating source data, mapping fields correctly, applying transformation rules, and checking the transform results, the team can achieve a controlled and repeatable data-import workflow.
